

Fig.1 Choropleth Map of Berkeley Census Tracts by Population

I was unable to complete the assignment in time. I switched datasets to study Police Stops from 2015-2022, and was able to merge two different datasets (with [different formats](#)) as well as compile two geojson files for mapping census tracts and police beats. I've run into errors converting coordinates into census tract numbers, and have not been able to find a dataset for actual crime data. If I can find this data however, I would like to test the model presented in [this city report from 2017](#) and see if distance from campus is actually still a main variable. I am also working on re-labelling the variables within stata, but I have uploaded my .do in the meantime so you can see what I have so far.
